

Outline:

I. playing with curves in \mathbb{P}^2

II. Affine algebraic geometry (structure of $\text{spec } A$)

III. Projective geometry

IV cohomology

thm: Nullstellensatz:

Maximal ideals of $\mathbb{C}[x_1, \dots, x_n] \longleftrightarrow$ points in $A^n (= \mathbb{C}^n)$

$(a_1, \dots, a_n) \in A^n$ max ideal $\mathfrak{M}_a = \text{kernel of hom. } \mathbb{C}[x] \rightarrow \mathbb{C}$
 $f(x) \mapsto f(a)$

$$\mathfrak{M}_a = (x_1 - a_1, \dots, x_n - a_n)$$

$A = \mathbb{C}[x]/I$ quotient of $\mathbb{C}[x]$, say $I = (f_1, \dots, f_n)$, $f_i \in \mathbb{C}[x]$

Cor: Then $\text{Spec } A = \{\text{max ideals}\} \xleftrightarrow{\text{bij}} V(I) = \text{locus of zeros}$

Why? b/c

thm Correspondence Thm: ideals of $A \xleftrightarrow{\text{bij}}$ ideals of $\mathbb{C}[x]$ that contain I

max ideals $\xleftrightarrow{\text{bij}}$ max ideals containing I

If A is finitely generated \mathbb{C} -algebra (ring that contains \mathbb{C}),

then $A \overset{\text{isomorphic}}{\sim} \mathbb{C}[x]/I$

$\text{Spec } A \xleftrightarrow{\text{max ideals}} V(I)$ variety in A^n
